Full fixed noisy case: 256×256×32

Frozen prediction vs corrected noisy data; fixed o0p0, middle z index 16, local z = 2.0625 µm. Shared linear scale.

Poor prediction recovery: full 15-exposure relative L2 errors are 0.6643 (signal) and 0.6643 (corrected mean). Relative image units = (counts − estimated blank mean) / estimated flat contrast; contrast is flat mean minus blank mean. This signed training residual is not held-out validation. One fixed noisy case; finite completion is not convergence or independent-repeat evidence.
