Full fixed noisy case: 256×256×32

Source coefficients on paired axial grid; fixed middle z index 16 / 31, local z = 2.0625 µm. Shared linear display scale.

Poor recovery: full-volume source relative L2 error = 0.9531. Relative units use the estimated flat contrast (flat mean minus blank mean). Fine axial cells are paired onto the coarser inverse grid; no voxel-volume/beam factor, alignment, crop or fitted scale. Profiles sum whole XY at every z. One fixed noisy case; finite fit is not convergence and re-rendering is not independent noise.
